BCSE302P - Database Systems Lab

Project – Submission Components (30 Marks)

(D2 slot- L11+L12)

Submission	Document Type	Marks	Due Date	VTOP Assessment
1	Project Proposal & Database Design Document	10	29-Sep-2026	Assessment 6
2	Complete Project Report	10	20-Oct-2026	Assessment 9
3	Project Presentation (PPT) & Demonstration	10	27-Oct-2026	Assessment 10
Total		30 Marks		

Assessment 6

1. Project Proposal & Database Design Document – 10 Marks

This should represent the initial planning and design phase of the project. It can be submitted before or during the initial stages of implementation.

Contents

1. Project Title

A clear and meaningful title.

2. Introduction and Background

Brief introduction to the domain and the problem being addressed.

3. Problem Statement

What real-world problem does the project solve?

4. Objectives

Clearly state the objectives of the database project.

5. Scope of the Project

Define what is included and excluded from the project.

6. Requirement Analysis

Identify the major requirements of the system.

For example:

- What data needs to be stored?
- Who will use the system?
- What operations need to be performed?
- What information needs to be retrieved or analyzed?

7. Database Selection and Justification

Students should mention:

- Database technology selected
- Type of database
- Reason for selecting it

For example:

- Relational database
- Document database
- Key-value database
- Graph database
- Cloud database

This makes the project suitable for any database technology, rather than restricting students to SQL.

8. Data Model / Database Design

This section should be flexible according to the database used.

For a relational database:

- ER Diagram
- Entities and attributes
- Relationships

- Relational schema
- Keys and constraints
- Normalization

For a NoSQL/document database:

- Collection design
- Document structure
- Embedded vs referenced data
- Sample document schema

For a graph database:

- Nodes
- Relationships
- Properties
- Graph model

Students should use the appropriate database design representation for their selected technology.

9. System Architecture / Workflow Diagram

A high-level diagram showing how:

Users → Application/System → Database → Output

Evaluation

Criteria	**Marks**
Problem definition and objectives	2
Requirement analysis	2
Appropriate database selection and justification	2
Database/data model design	4
Total	10
